Ethylene Glycol based water solutions are common in heat-transfer applications where the temperature in the heat transfer fluid can be below 32 o F (0 o C). Ethylene glycol is also commonly used in heating applications that temporarily may not be operated (cold) in surroundings with freezing conditions - such as cars and machines with water

Ethylene Glycol Heat-Transfer Fluid

Pure ethylene glycol has a freezing point of -12.9°C , and water's freezing point is 0°C . So, the solution's freezing point should actually be below $\mathbf{0^{\circ}\text{C}}$ (what occurs is freezing point depression due to colligative properties of adding solutes into a
