Simulink Matlab Three Phase Fault

Description. The Three-Phase Fault block implements a three-phase circuit breaker where the opening and closing times can be controlled either from an external Simulink ® signal (external control mode), or from an internal control timer (internal control mode). The Three-Phase Fault block uses three Breaker blocks that can be individually switched on and off to program phase-to-phase faults, phase-to-ground faults, or a combination of phase-to-phase and ground faults.

Three-Phase Fault - MATLAB & Simulink

The Fault (Three-Phase) models any permutation of a single-phase, two-phase, or three-phase grounded or ungrounded fault. The block can impose both time- and event-based faults. The block can impose one or both type of faults, consecutively, at the same time, or for an overlapping time period. For a time-based or temporal fault, specify the fault activation time using the block Fault start time parameter.

The arc extinction process of the Three-Phase Fault block is the same as for the Breaker block. See the Breaker block reference pages for details on the modeling of the single-phase breakers. If the Three-Phase Breaker block is set in external control mode, a control input appears in the block icon.

Three phase short circuit faults According to, a 3-phase short circuit faults also known as symmetrical or balanced fault implies that all three phases of the power system are simultaneously short-circuited to each other through a direct or "bolted" connection. These faults can be with or without ground as shown in Fig. no. 4.
